NIM: 123180137

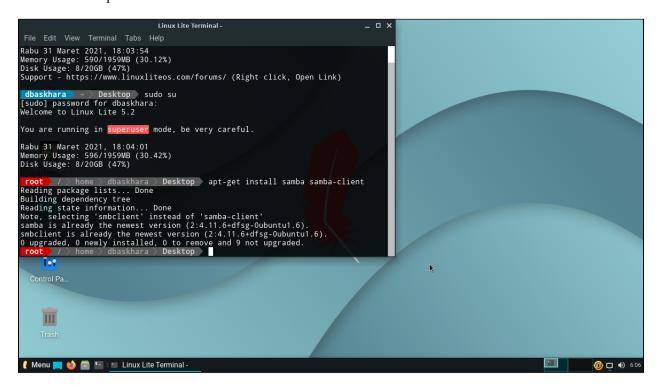

Kelas : E

- 1. What protocol allows clients to use SSH to access and transfer files over the Internet?
- 2. Which disk type has no moving parts?
- 3. Which disk type is used primarily for off-site storage?
- 4. What allows for packet modification so that multiple devices can share a single public IP?
- 5. What protocol allows you to distribute HTML files over the Internet?
- 6. What tier level is used to store data for compliance requirements?
- 7. What technology allows you to combine multiple hard drives into a single logical unit?
- 8. Which RAID level stores the data exactly the same on two disks?
- 9. Which RAID level combines block-level striping and parity?
- 10. Which file system was created specifically for Linux?
- 1. SSH File Transfer Protocol (SFTP)
- 2. Solid-state storage (SSS)
- 3. Tape storage
- 4. NAT
- 5. Hypertext Transfer Protocol (HTTP)
- 6. Tier 4
- 7. RAID
- 8. RAID 1
- 9. RAID 10
- 10. Ext

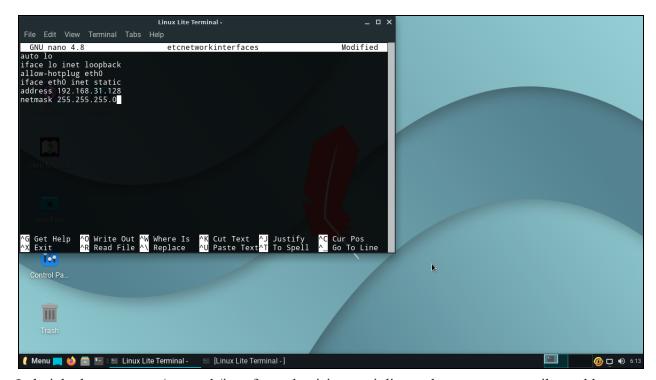

Pembuatan Data Center

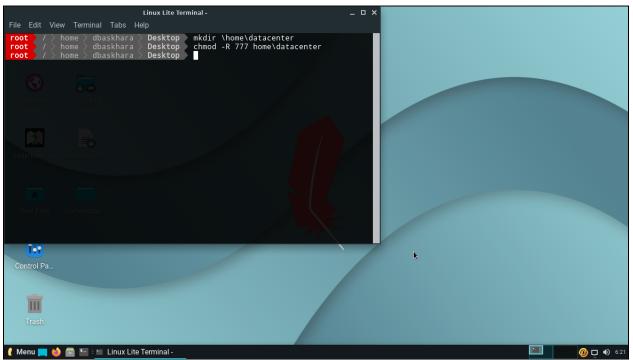

Masuk di terminal lalu jalankan perintah $sudo\ su$, perintah ini akan membuat user memiliki akses root ke pada sistem untuk membuat data center

Instal samba menggunakan perintah apt-get install samba samba client lalu tunggu proses selesai

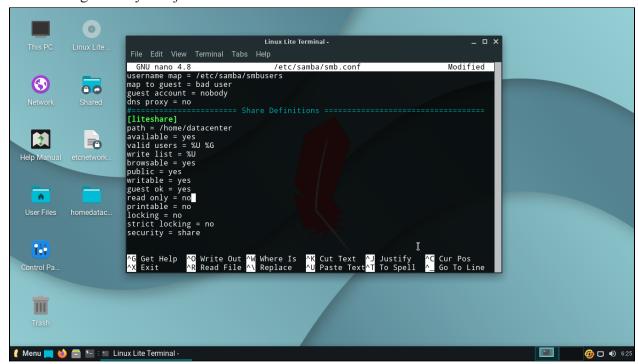

Lalu jalankan nano etc/network/interfaces dan isi seperti di atas dengan menyesuaikan address dan netmask

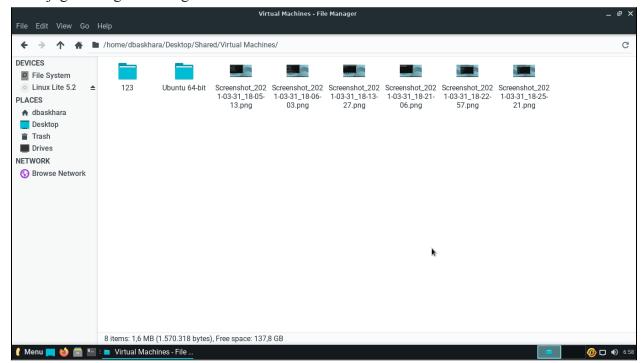

Setelah itu buat folder yang akan menjadi data center dengan *mkdir* kemudian tempat penyimpanan dan nama folder. Lalu dilanjutkan dengan *chmod -R 777* untuk mengaktifkan

Ubah setting security menjadi share

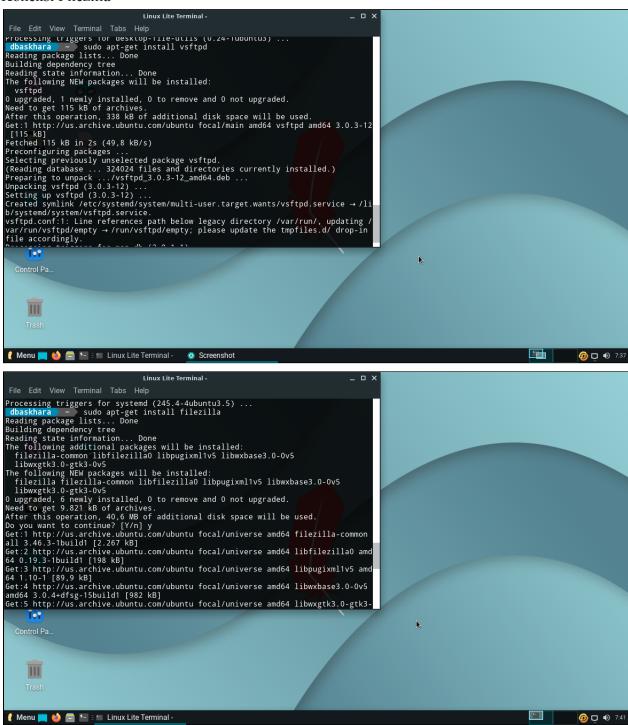

Ubah juga setting untuk bagian bawah

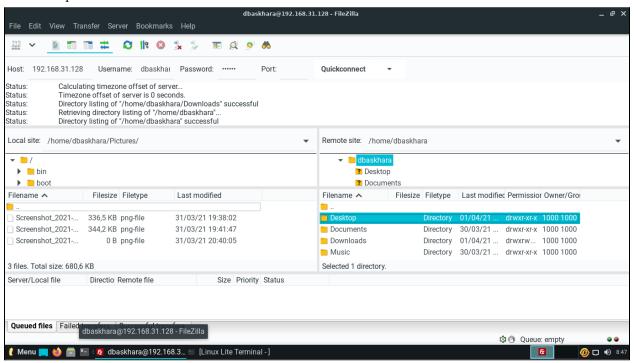

Tampilan file shared, dicoba diisi dengan file screenshot

Koneksi Filezilla

Instal vsftpd dan filezilla

Masukkan host , username password dan port kemudian connect , jika benar maka remote site akan keluar dan bisa digunakan
